

Inventory Control

Millennium III

A Critical Component to Business Success

Keeping a close eye on inventory is a critical function in any business. However, too many companies have a visibility problem – they can't see their entire inventory from every office location, or gauge its costs and status across the supply chain. This can lead to customer service issues and production problems that remain unaddressed for too long. All of these inventory control problems are usually the result of antiquated processes and support systems.

An ERP System Can Help – As Long As it's the Right System

- Does your current system lose track of parts?
- Are you unable to look for parts by a variety of methods, including description and category?
- Is your inventory not updated on a real time basis?
- Do you have multiple locations that require instant visibility?
- Are inventory issues causing customer service problems?
- Are you missing the right inventory at the right time?

If the answer to any of these inventory control questions is yes, it's time to turn over the complexities involved in planning, executing and controlling your inventory to Millennium III. With M3, Rover Data Systems has developed and implemented a state-of-the-art ERP System that integrates all of your manufacturing, distribution and related applications into one easy-to-use system.

With the M3 system as your company's central information access point, inventory control is simplified, productivity is increased, quality is maintained, and your company can run more efficiently.

"If someone wants to know how many machines we sold in 2002, in a particular territory or in a particular month, I can pull that information up right away in the software. M3 is the heart of our business, and we treat it like gold."
